Module Manager

The Module Manager gives platform administrators a central place to view, enable, and disable Pilot modules across all sites. Every module — from marketing tools to commerce extensions —

is displayed as a card showing its status and usage at a glance.

Key Features

- **Module Cards:** Each module appears as a card with its name, color-coded category badge, description, version number, and how many sites currently have it active.
- **Enable / Disable Toggle:** A toggle switch in the top-right corner of each card turns a module on or off globally with a single click. Disabled cards appear slightly faded with a gray border so you can spot them at a glance.
- **Installation Indicator:** A green checkmark in the card footer means the module's files are properly installed. A yellow warning icon means the module folder is missing — the toggle may show it as enabled but it won't function.
- **Category Filter:** Use the **Category** dropdown above the grid to show only Marketing, Engagement, Content, Commerce, or Collaboration modules.
- **Search:** Type in the search bar to filter by name, description, or category — results update instantly.
- **Sort Controls:** Click any column header to sort by Module name, Category, Active Sites, or Status.
- **Module Details:** Click the **Details** button on any card to open a popup with the full module breakdown, including which sites have it activated, each site's URL, activation status, and the date it was turned on.

How to Use

Enabling or Disabling a Module

1. Find the module using the search bar or Category filter.
2. Click the toggle switch in the top-right corner of the card.
3. A confirmation message appears and the list refreshes to show the updated state.

Disabling a module affects it globally — it becomes unavailable across all sites until re-enabled.

Viewing Module Details

1. Click the **Details** button on any module card.
2. The popup shows version, category, enabled/disabled status, and whether the module files are installed on the server.

3. A table lists every site using this module — with each site's name, URL, activation status, and the date it was activated.

Filtering and Searching

1. Type in the search bar to match modules by name, description, or category.
2. Use the **Category** dropdown to narrow the list to a specific group.
3. Select **All Categories** to clear the filter.

Tips

- The **Sites** count on each card shows how many sites currently have that module active — check this before disabling to understand the impact.
- A yellow warning icon means the module's files are missing from the server, even if the toggle shows it as enabled. Contact your platform administrator to reinstall the module.
- The list defaults to alphabetical order. Use the sort controls to reorder by Active Sites or Status to quickly find the most-used or disabled modules.
