# Page Management

Create, configure, and manage all pages within the platform. This admin-only tool controls which pages exist, where they appear in the navigation, and what resources they use.

## Key Features

- **Page List:** View all system pages with their title, path, menu location, display order, and active/inactive status at a glance.
- **Create New Pages:** A two-step wizard guides you through setting up a new page and automatically generates all required files.
- **Template Types:** Choose between a Basic Page (standard content display) or a CRUD Page with Database (for managing database records with a built-in list).
- **Navigation Control:** Assign pages to the sidebar, top bar, or no menu at all.
- **Edit Pages:** Update a page's name, navigation settings, icon, and associated files — organized into Basic Information, Navigation Settings, and Page Assets sections.
- **Deactivate Pages:** Removing a page hides it from all menus while preserving its files for recovery.
- **Sortable List:** Click any column header to sort pages by title, path, menu location, order, or status.

## How to Use

### Creating a New Page

1. Click **Create New Page** in the top right corner.
2. **Step 1 — Name and type:** Enter a page name and select the template type.
  - Choose **Basic Page** for a standard content page.
  - Choose **CRUD Page with Database** to build a page that manages records from a database table.
3. Click **Next**.
4. **Step 2 — Settings:** Configure the page's navigation and appearance.
  - Select a **Menu Location:** Sidebar, Top Bar, or No Menu.
  - Enter an **Icon** class (e.g. `fas fa-star`) to display alongside the menu item.
  - For CRUD pages, select the **Database Table** the page will work with. Optionally check **Generate List Configuration File** to auto-scaffold the list setup.
  - Review the auto-generated asset file paths (view, handler, JS, CSS). Add or remove files as

needed.

5. Click **Create Page**. The page and all its supporting files are created automatically.

## Editing a Page

1. Find the page in the list and click **Edit**.
2. The edit form is divided into three sections:
  - **Basic Information**: Edit the page name. The path and template type are shown for reference and cannot be changed.
  - **Navigation Settings**: Update the **Menu Location** or **Icon**.
  - **Page Assets**: Add or remove view, handler, JavaScript, CSS, or support files associated with this page.
3. Click **Save Changes**.

## Deactivating a Page

1. Find the page in the list and click **Delete**.
2. Confirm the action when prompted.
3. The page is removed from all menus and marked as inactive. Its files are preserved on the server.

## Searching and Sorting

- Use the search bar to filter pages by title, path, or description.
- Click any column header to sort the list. Click again to reverse the sort order.

## Tips

- **Active vs. Inactive**: The Status column shows a green badge for active pages and a red badge for inactive ones. Inactive pages still appear in this list so you can reactivate them if needed.
- **Auto-generated paths**: When you type a page name in Step 1, the URL path and all asset file names are generated automatically — you rarely need to change them in Step 2.
- **CRUD pages and database tables**: The database table dropdown is populated from the live database, so only existing tables appear.
- **Support files**: Support Files track reference or backup files associated with a page but are not loaded when the page runs.
